# Introduction

EVSE stands for *electric vehicle supply equipment*. It is an element that supplies electric energy for the recharging of electric or plug-in vehicles.

## Read me first

The EVSE board is supplied with default 32A settings. Please check the chapter *Application examples* for more information about further possibilities of changing maximum charging current. 220 Ohm R<sub>PP</sub> is included with the kit (pre-hard-wired).

## Theory of operation

Pilot signal duty cycle provided by EVSE defines maximum charging capacity. The car can define several states by pulling the pilot signal down to certain voltage levels (3V, 6V, 9V). Based on this feedback EVSE will trigger the relay for the vehicle to charge or evaluate the state as an error (electricity will not be provided to the output socket/connector).

<b>Resistance PP-PE (max cable throughput)</b>		
<b>Resistance [ohm]</b>	<b>Current limit [A]</b>	<b>Wire cross-section [mm<sup>2</sup>]</b>
> 1500 *	6	--
1500	13	1.5
680	20	2.5
220	32	6
100	63	16
<100 **	80	—

\* no resistor connected

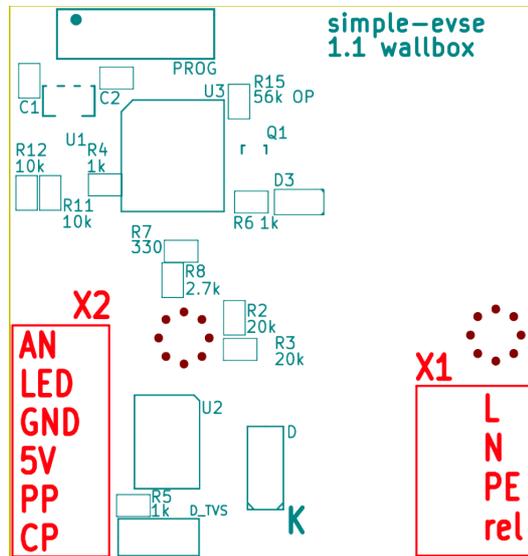

\*\* recommended ~50 Ohm

## Compatibility

- Tesla Model S
- Nissan Leaf
- Mitsubishi iMiev (Peugeot iOn, Citroen cZero)
- Opel Ampera
- eGolf
- Mitsubishi Outlander PHEV
- Citroen Berlingo Electrique
- and others

# Board description

Simple EVSE board has 2 connectors. 4-pin X1 for high voltage side and 6-pin for signaling wires and control. There is also PROG connector used for new firmware flashing (ICSP) and can be further used for adjusting EVSE current (see Features chapter).

X1, X2 and PROG connector

X1 connector		
pin	name	description
L	phase	230V power supply for EVSE board and external contactor
N	neutral	
PE	protection-earth	Ground reference
rel	relay output	This output drives coil of an external contactor. Maximum allowed current is 3A.

X2 connector		
pin	name	description
AN	analog input	Used for button or current sensor input
LED	external LED	Includes 1k resistor onboard, connects to LED anode against ground
GND	ground	Ground reference
5V	5V power output	Used as a power supply for external current sensor (max 40mA)
PP	proximity pilot	To vehicle connector
CP	control pilot	To vehicle connector

<b>PROG connector</b>		
<b>pin</b>	<b>name</b>	<b>description</b>
1	V <sub>PP</sub>	ICSP** / RFU* [marked by rectangle]
2	V <sub>DD</sub>	5 V
3	GND	Ground
4	DAT	ICSP** / current boost function
5	CLK	ICSP** / current limit function

\* reserved for future use

\*\* firmware upgrade interface

## Features

### Current limitation – using PROG pin 5

Check the table for details of how you can set the maximum current. This settings will override PIN 4 settings.

<b>PROG connector</b>	<b>connection</b>	<b>current limit</b>
pin5 > 4.5 V	open (internal pull-up only)	32 A [default]
2.5 V < pin5 < 4.5 V	100-200k* resistor to GND	25 A
0.2 V < pin5 < 2.5 V	~3-20k* resistor to GND	16 A
pin5 < 0.2 V	tied to GND	10 A

\* resistor value may differ since internal pull-up has no defined value from production (~50k supposed), in most cases 100k for 25A and 5k for 16A is recommended

### Current boost – using PROG pin 4

Check the table for details of how you can set the maximum current.

<b>PROG connector</b>	<b>connection</b>	<b>current limit</b>
pin4 > 4.5 V	open (internal pull-up only)	32 A [default]
2.5 V < pin4 < 4.5 V	100-200k* resistor to GND	48 A
0.2 V < pin4 < 2.5 V	~3-20k* resistor to GND	63 A
pin4 < 0.2 V	tied to GND	80 A

\* resistor value may differ since internal pull-up has no defined value from production (~50k supposed), in most cases 5k for 63A and 100k for 48A is recommended

## **Precise current setting with Analog Input**

Press and hold button connected to Analog input AN of X2 for a few seconds until LED starts to blink rapidly. Then count LED blinks which correspond to number of amperes. Please note that this limit will be set until you reboot the EVSE (make a power cycle). Button is connected the way that pulls the signal down to ground (level <1V).

## **Current limitation based on external hall sensor (experimental)**

Simple EVSE Wallbox can tell the vehicle to follow the actual PV power plant production. Only hall sensor (Amploc 25) output must be connected to the analog input of the board (AN). Sensor is powered from 5V. Current will be gradually increased when overflow to a public network is detected. When PV production decreases then duty cycle will be reduced down to a minimum of 6A charging current.

## **External LED**

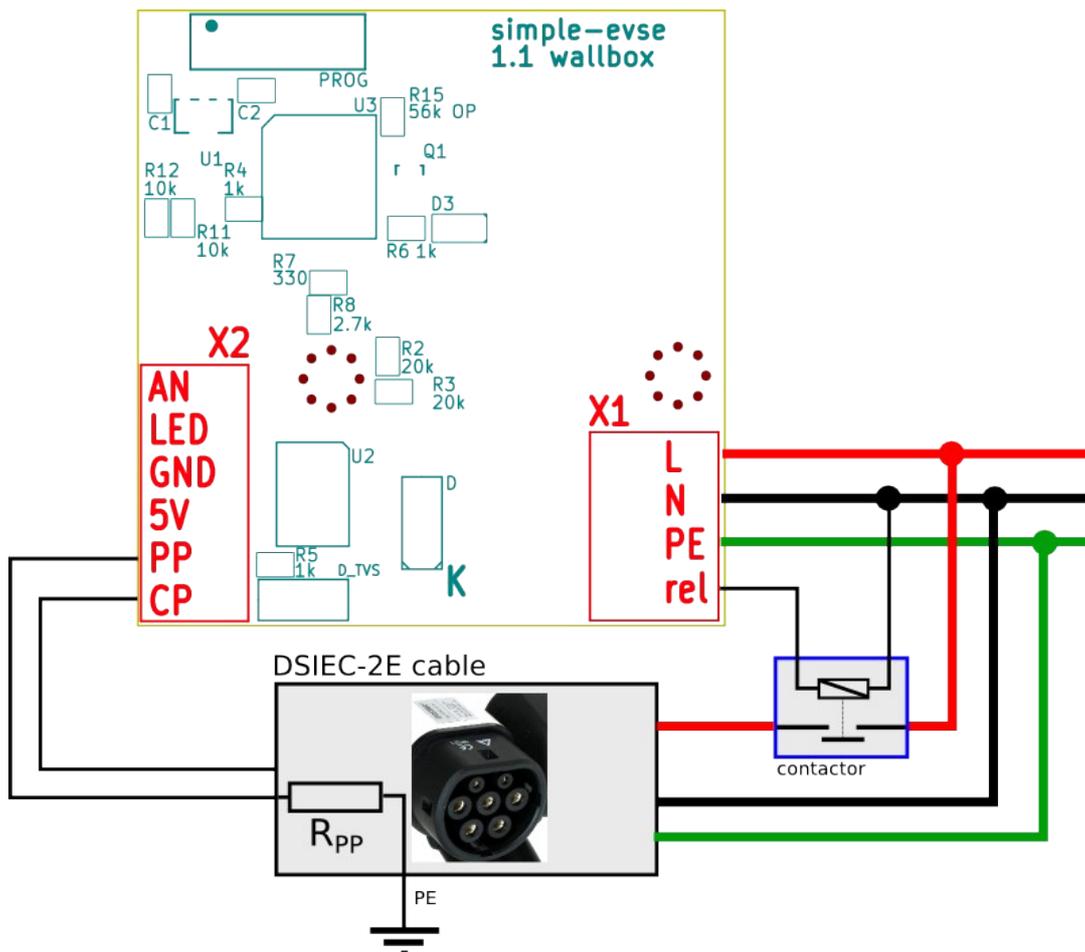

Using the pin LED you can directly connect LED to indicate EVSE status. The output includes 1k resistor. External LED has the same indication function as LED onboard.

# Application examples

In these application examples we suppose that customer uses appropriate contactor with 230V coil.

## Minimal connection

1 phase EVSE using DSIEC-2E cable. PWM duty will be limited by the size of  $R_{PP}$  (refer to the *Theory of operation* chapter). If you do not connect any  $R_{PP}$  current will be limited to only 6A. If your EVSE includes cable which cannot be exchanged for weaker one then you can hard-wire  $R_{PP}$  resistor for cable's nominal value.

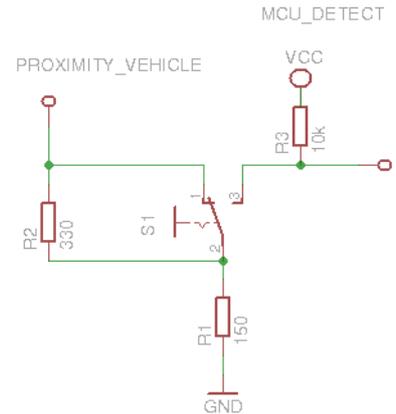

DSIEC-2E Type2 connector - signal and power wires

### 32A EVSE with connector J1772

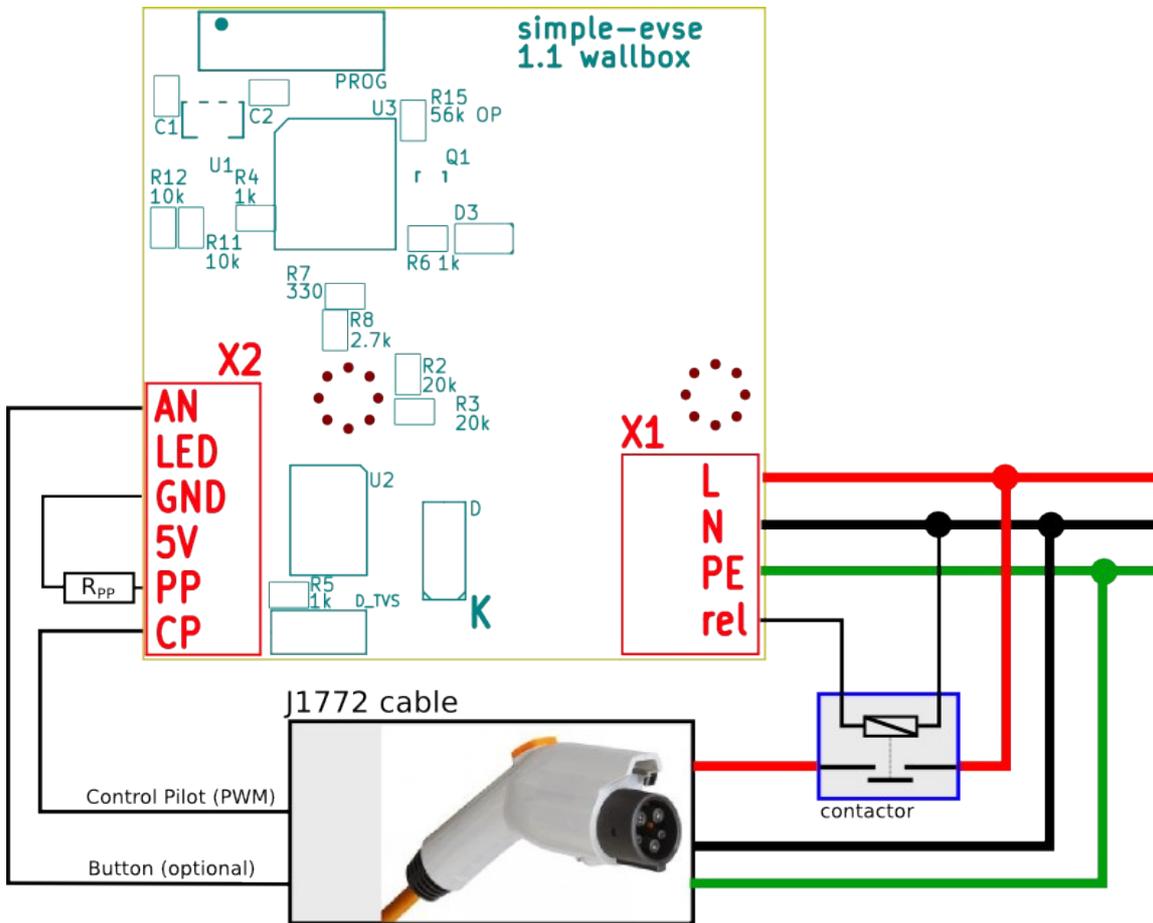

With EVSE Wallbox board you can quickly build a charging station for your Nissan Leaf 6.6kW or any other vehicle equipped with J1772 plug.

#### Optional Analog Input connection:

The internal J1772 connection allows to use S1 proximity button as an auxiliary button for EVSE. With the help of this button you can easily change charging current with the smallest step of 1A (see Features - Precise current setting).

J1772 proximity button connection detail

## Customer solutions

*J1772 EVSE with 32A CEE 5pin plug (sent by 1gachren)*

*Schuko 16A Tesla charging plug (sent by sefik)*

# New firmware flashing

By flashing new firmware you could possibly upgrade the EVSE to support some future improvements which are currently not known. Microchip IPE utility + PICKit 3 hardware is required for this purpose. (<https://microchip.wikidot.com/ipe:what-is-ipe>)

*Using PICKit3 to flash new software*

1. install MPLAB X software (<http://www.microchip.com/mplabx/>)
2. enable advanced mode in settings and check “Power Target Circuit from Tool” in “Power” tab on the left
3. put device id “PIC16F1825” and connect to your PICKit
4. select HEX file and click “Program” the device
